Outline

Introduction

- In these slides we show how Overleaf can be used with standard chemistry packages to easily create professional presentations.

- If you're new to LaTeX, check out this free introductory course by Overleaf founder Dr John Lees-Miller: `www.overleaf.com/blog/7`

- You can also find more quick tips and tricks on the help pages at `www.overleaf.com/help`

The chemistry packages

We focus on two LaTeX chemistry packages:

The `chemfig` package

This package provides the command which draws molecules. Created by Christian Tellechea, a detailed user guide can be found here:

`www.tex.ac.uk/ctan/macros/generic/chemfig/chemfig_doc_en.pdf`

The `mhchem` package

The `mhchem` package provides simple commands for typesetting chemical molecular formulae and equations. Created by Martin Hensel, a detailed user guide can be found here:

`http://mirror.ox.ac.uk/sites/ctan.org/macros/latex/contrib/`
`mhchem/mhchem.pdf`

Chemical equations with `mhchem`

- The `mhchem` package lets you write chemical equations in LaTeX with the minimum of effort.

- The example below shows how the standard representation of a reaction (on the left) is created from the simple code on the right:

  $CO_2 + C \longrightarrow 2\,CO$ is created with `\ce{CO2 + C -> 2CO}`

- More complicated reactions are still easy to write:

$$SO_4{}^{2-} + Ba^{2+} \longrightarrow BaSO_4 \downarrow$$
is created with

`\ce{SO4^2- + Ba^2+ -> BaSO4 v}`

Getting started with some `chemfig` coffee

It's easy to use the `chemfig` package for drawing complex molecules:

This is the caffeine molecule, represented clearly and neatly, and built from a single line of text:
`\chemfig{*6((=O)-N(-CH_3)-*5(-N=-N(-CH_3)-=)--(=O)-N(-H_3C)-)}`

If that looks quite daunting, we can learn from simpler molecules... how about a single water molecule?

Experiments with water and rings

To see how the `chemfig` package creates the drawings from your code, let us look at the simple water molecule:

$$H_2O \text{ is created with } \backslash\text{chemfig\{H\_2O\}}$$

The simple LaTeX code on the right is automatically converted into the molecular formula for water on the left.

Rings are similarly easy to code - consider the examples below:

 = \chemfig{A*5(-B-C-D-E-)}

 = \chemfig{*6(=-=-=-)}

suggestions. . .
